

Getting your message home is now easier than ever with the Spring 2010 Release. A number of features that you commonly use have been enhanced. Below are some highlights.

Improved Classroom Messaging

Empower teachers and other frontline staff to respond to a range of student-specific scenarios by drawing from a library of hundreds of professionally translated Classroom Comments available in over 25 languages. Classroom Messaging is available with selected subscription plans.

HTML Email

Send beautifully designed emails complete with rich text, graphics and other formatting. Plus, system administrators can control look, feel and header/footer text through a district-wide template.

List sharing

Authorized users can now create and publish lists which can be subscribed to by other users. When the list owner makes changes to the list, these changes are immediately available to the other users which have subscribed to this list. This is particularly helpful for cases where a few users in a single school or a department need to share a frequently used list.

Message sharing

Easily share messages across multiple user accounts. This is ideal for frequently used district-wide messages that more than one user needs access to, such as pre-recorded closure notices.

Contact data change reporting

Track and export changes made to contact data – whether the change is made by school/district users or by parents in Contact Manager – so that source data in the student information system can be updated. Contact Manager is available with selected subscription plans.

Guided Survey editor

Quickly create a multi-question survey and poll parents through phone and/or web with the improved survey workflow. The survey editor has been completely redesigned in a similar manner as the Message Sender.

LDAP authentication agent

Streamline the management of user accounts by integrating with the district's LDAP server. Contact your Account Manager for additional information on deployment options.

Message grouping

Message content (phone, email and SMS) is now aggregated into a single object referred to as a message group. Users can now create a multi-lingual message object that contains phone, email and SMS content and it will display as a single object with a single name that can be selected during the Message Sender process. This simplifies message management and use.

And more...

You may notice a number of other enhancements as you use various features. Enhancements and new features come from requests made by our user community, so feel free to send your own suggestions for improvement to feedback@schoolmessenger.com
